Markov Chains - Gibbs Fields, Monte Carlo Simulation and ...

Bremaud is a probabilist who mainly writes on theory. This is no exception. It is an advanced mathematical text on Markov chains and related stochastic processes. As with most Markov chain books these days the recent advances and importance of Markov Chain Monte Carlo methods, popularly named MCMC, lead that topic to be treated in the text.

Markov Chains: Gibbs Fields, Monte Carlo Simulation, and ...

The author begins with the elementary theory of Markov chains and very progressively brings the reader to more advanced topics. He gives a useful review of probability, making the book self-contained, and provides an appendix with detailed proofs of all the prerequisites from calculus, algebra, and number theory.

1.1 The distribution of a Markov chain A particle moves on a denumerable set E . If at time n , the particle is in position $X_n = i$, it will be at time $n + 1$ in a position $X_{n+1} = j$ chosen independently of the past trajectory X_{n-1}, X_{n-2} with probability p_{ij} .

The emphasis in this book is placed on general models (Markov chains, random fields, random graphs), universal methods (the probabilistic method, the coupling method, the Stein-Chen method, martingale methods, the method of types) and versatile tools (Chernoff's bound, Hoeffding's inequality, Holley's inequality) whose domain of application extends far beyond the present text.

Markov chains : Gibbs fields, Monte Carlo simulation and ...

In the book by Pierre Bremaud it is written that "For any irreducible Markov Chain, one can find a unique partition of E (state space) into d classes C_0, C_1, \dots, C_{d-1} such that for all k , if $i \in C_k$, then $\sum_j \in C_k + 1 p_{ij} = 1$, where by convention $C_d = C_0$, and where d is maximal (i.e. there is no other such partition C'_0, C'_1, \dots, C'_d ."
